

LIVING DOWNSTREAM

About the Film

Raised in small-town Illinois, cancer seems to run in Sandra Steingraber's family. Sandra was diagnosed with bladder cancer when she was just twenty years old. Her mother was diagnosed with breast cancer when Sandra was in high school. Many of her aunts and uncles have battled the disease. One aunt even died from the same form of bladder cancer that Sandra had. But while cancer runs in her family, she cannot say that it runs in her genes. Sandra is adopted. This unusual twist led Sandra to ask what else families have in common besides their DNA. The answer is all around us: our environment.
